---

Review this manual and the supplied working drawings (including floor plan dimensions) before work begins.
Warmboard-R is a hydronic radiant panel made from oriented strand board (OSB) with a conductive .025” thick 1060 aluminum alloy skin bonded to the entire top surface. Each panel type is stamped with a series of aluminum channels on the top surface to hold 1/2” PEX or PEX-AL-PEX tubing.

Warmboard–R consists of two panel types. Panels weigh approximately 25lbs and measure 23 7/8” x 48” and are 13/16” thick. In a completed assembly, Warmboard–R weighs 3.2lbs per square foot, which includes the panel, tubing and water.

Warmboard–R is typically installed over concrete or subfloor, though is also used in walls and ceilings.

Non-aluminum filler panels are also available.

Warmboard panels are but one component in a complete radiant system. Complete system design should be performed in accordance with Radiant Professionals Alliance (RPA) guidelines, manufacturers’ recommendations for ancillary components, and is the responsibility of the system designer.
1 Count your panels when they arrive on site and confirm the shipment is correct. If there are any questions or inconsistencies with your plan set, call us immediately.

2 The existing subfloor should be reasonably smooth and flat prior to the installation of Warmboard–R. Inspect for squeaks and refasten to joists if necessary.

3 Warmboard–R and the subfloor must be dry prior to installation. Warmboard–R CANNOT be exposed to rain before or after installation.

4 Gap 1/8" between panels on the 4' side. Use the alignment pins when fastening to ensure the tubing paths between panels line up.

5 ONLY use tubing approved by Warmboard, Inc. Silicone or other types of adhesives should not be used on tubing.

6 Tubing layouts for Warmboard–R can be quite flexible. Make field revisions as needed but DO NOT exceed 275 linear feet per loop.

7 Custom routes require a minimum 1.75 horsepower router, though 3hp is recommended. A Porter Cable router will interface with the template guides provided. DO NOT attempt a custom route without the proper template guide (page 7).

8 When Warmboard is installed over a crawl space or existing subfloor, a minimum of R-19 insulation is required beneath the panels to prevent downward heat loss.

9 Review the installation manual before installing finish floors.

10 The surface temperature of finished floors is not to exceed 85°F. This rule applies to the entire radiant industry, and is endorsed by the Radiant Professionals Alliance (RPA) and International Association of Plumbing and Mechanical Officials (IAPMO).
Approved Tubing List

PEX ALUMINUM PEX TUBING, 1/2" ID

- Warmboard PEX: PEX-AL-PEX
- Bluefin: PEX-AL-PEX
- Mr. Pex: PEX-AL-PEX
- Watts: PEX-AL-PEX

ONLY use tubing found on this tubing list. Using other products may create ticking noises during operation as the EVOH barrier rubs against the channel.

Warmboard, Inc. provides tubing and manifolds at very competitive prices. Ask for details.

PEX TUBING, 1/2" ID

- Mr. Pex
- Rehau Raupex Oxygen Barrier
- Uponor Wirsbo hePEX
- ViegaPEX Barrier
**Necessary Tools**

**INSTALLATION KIT INCLUDES**  
(supplied with each order)
- Warmboard panel/tubing plans
- 3 Custom routing templates (wood)
- 5/8" Router bit
- 2 Alignment pins
- Porter Cable template guide
- Porter Cable guide lock nut

**ADDITIONAL MATERIALS AND TOOLS**
- Circular saw, carbide blade
- Porter Cable router, minimum 1.75 horsepower (3hp recommended)
- Electrician nailing plates
- 16 oz Rubber mallet
- Warmboard approved tubing
- Shop vacuum
- Drill motor with a 3/4" drill bit
- PEX tubing cutter
- Wax pencil or permanent marker
- Tubing un-coiler
- 4" Grinder or dremel
Choosing the Correct Router

While we recommend a Porter Cable router with a minimum 1.75 horsepower, 3hp is preferred. Router not provided.

Not all Porter Cable sub-bases interface properly with the supplied Porter Cable template guide. DO NOT attempt a route without the correct template guide.

These are correct template guides to use with the Porter Cable router and are shipped to you with your Warmboard Installation Kit. They are 1" OD.

Porter Cable template guide lock nut, part no. 42237
Porter Cable template guide, part no. 42030 25/32" I.D., 1" O.D.
5/8" Core Box Router Bit

This is the correct sub-base with the supplied metal template guides installed.

This sub-base does NOT work with our template guide and will not create custom routes.
Installing over Subfloor

PREPARATION

It is essential that the existing subfloor is both flat and smooth before the installation of Warmboard. Inspect the subfloor for evenness along the joists and flatness between the joists.

If necessary, sand the subfloor and install extra blocking below. Inspect for squeaks and refasten with decking screws as necessary.

Cutting and installing Warmboard–R is very straightforward. The panels can be trimmed with a standard skill or table saw and will rip just like ordinary OSB.

The subfloor and Warmboard–R must be completely dry, with a moisture reading between 8-12% before, during and after installation. Do not expose Warmboard–R to rain before or after installation.

METHOD 1 SCREW ONLY

Use a #8 x 11/2” “GRK Uber Grade” multi-purpose R4 screw (or equivalent) with a top 1/2” smooth shank (available at homedepot.com). Fasten with in a pattern of 3 rows of 4.

- No pre-drilling required
- Self-counter sinking
- No adhesive needed

METHOD 2 NAIL AND GLUE

Using a construction adhesive designed for bonding OSB to plywood, such as “Loctite PL Wood” (or equivalent) is an excellent choice. Follow all directions specified by the adhesive manufacturer.

For nailing, use a ring shank or a screw nail. To determine the appropriate length of the nail to use, evaluate existing thickness of subfloor and add 13/16". Fasten nails with a pattern of 3 rows of 4.

It is crucial to use the alignment pins to line up the channels from panel to panel.

Cut panels with the aluminum side down.
**Installing over Slab**

**BENEFITS**

Installing Warmboard–R over a concrete slab can retrofit a basement or home remodel with a state of the art radiant floor heating system. A broad range of finish floor options are available, including hardwood, tile, carpet, vinyl and linoleum.

**CONCRETE SLAB REQUIREMENTS**

The existing slab must be level and flat. A newly poured slab needs to be well-cured for a minimum of 30 days, and a moisture test should be conducted to ensure the slab is properly cured prior to installation of Warmboard–R.

Like any wood product, if Warmboard–R panels are exposed to standing water or moisture intrusion, the wood will swell and rot. **DO NOT** use Warmboard–R if these environmental conditions are possible during or after construction.

**TESTING FOR MOISTURE**

There are several methods by which to test the moisture content of a newly poured slab, the simplest being “The Plastic Sheet Method” (ASTM D 4263-83). For this method, place an 18” x 18” clear plastic sheet on the slab and tape down on all sides. Do not allow the sheet to come in contact with direct sunlight or excessive heat. After 16 hours, if any condensation is found on the underside of the plastic, or if the slab surface is darkened, the concrete is too wet for a coating application.

It is possible for this method to yield a false result in cooler conditions, where the concrete may retain moisture and fail to condense on the plastic.

With the Plastic Sheet Method, the best way to ensure a reliable result is to make sure that the surface temperatures and ambient conditions during the test are very similar to those present after the Warmboard panels are installed.

If not performing a moisture test, we recommend giving a newly poured slab 90 days to cure fully. Once certain of the moisture level of the slab, we recommend one of two installation methods.

**METHOD 1 FASTEN DIRECTLY**

Install a 6- or 10-mil polyethylene vapor retarder directly to the slab, overlapping two feet (2’) at the seams. Continue with Warmboard–R panel installation using Split Drive Anchors, Tapcon concrete fasteners or Powder-Actuated Fasteners. We recommend a maximum of 9 fasteners for each panel.

**METHOD 2 WITH INSULATION**

Install a 6- or 10-mil polyethylene vapor retarder directly to the slab, overlapping two feet (2’) at the seams. Next, install a 1/2” Homasote Comfort Base or Homasote 440 Soundbarrier over the entire slab (adding a R-value of 1.2). Gap all Homasote panels 3/16” from all adjoining panels and 3/8” from walls. Use fasteners to attach the entire assemble to slab. We recommend 9 fasteners per panel. Review the installation instructions of the Homasote Comfort Base and 440 Soundbarrier at [homasote.com](http://homasote.com)

*Warmboard panels must be mechanically fastened, not just floated or glued.*

*The slab must have sufficient drainage from rain and show year round.*

*DO NOT use Warmboard–R if these environmental conditions are possible during or after construction.*
FASTENING TO CONCRETE

Concrete drilling should be done with the Warmboard panels in place (pre-drilling the concrete is not recommended). Use a heavy duty roto hammer drill and a high-quality 1/4" masonry drill bit. The hole should be 1/2" deeper than the required specification. Once drilled, draw the drill bit in and out a few times to loosen excess material. Use a shop vacuum to remove the debris, then choose one of the following methods to fasten the Warmboard panels to the concrete:

- **Method 1 Split Drive Anchors**
  Use a 3lb. sledge hammer to force the Split Drive Anchor through the pre-drilled panel and into the concrete

  ![Split Drive Anchor Diagram]

  2 1/2" x 1/4" Flat Head Split Drive Anchor
  Use 1/4" high-quality masonry bit

- **Method 2 Tapcons**
  Simply install the Tapcon through the pre-drilled hole and into the concrete

  ![Tapcon Diagram]

  2 1/4" x 1/4" Flat Head Tapcon Concrete Screw
  Use 3/16" high-quality masonry bit

- **Method 3 Powder Actuated Fasteners**
  Choose an actuated tool, and charge, that is designed for fastening 1 1/8" plywood to concrete. For sizing, choose a fastener that will grab a minimum of 1" of concrete

  ![Powder Actuated Fastener Diagram]

  0.138" X-C P8 Powder-Actuated Fastener from Hilti. Use Hilti DX 2 Semi-Automatic Powder-Actuated tool

If using Homasote between the slab and Warmboard panel, the fastener will need to be longer than 2 1/4".

We highly recommend using a Flat Head Split Drive Anchors. They will save you many hours of labor.

Split Drive Anchors may be difficult to find in retail locations. We suggest confast.com or calling 888.498.5747
Custom Routing

CHECK LIST

► Review all the tubing layout plans
► Use a permanent marker and the provided wood templates to mark all areas on the Warmboard panel that will require custom routing
► Prepare router with router bit, template guide and template guide lock nut

PROCEDURE

► Place the routing template over the appropriate area and fasten into position with 3 screws. Be sure the screws do not interfere with the path of the router
► Ensure that the router bit and template guide are properly installed, then proceed with the route
► When complete, remove the template guide and use a 4” grinder, dremel or deburring tool to smooth the area for the tubing installation
► Use a shop vac to clear debris from the channel
► Place a piece of tubing into the new groove to confirm it sits level and flush with the top of the Warmboard panel

Front view
1. CLEAN TUBING CHANNELS, PANEL

This simple, but important step of the process will ensure the tubing sits flush and level – which is essential to a well functioning radiant system.

- Use a broom, shop vacuum or leaf blower to clear the debris from the panel and tubing channels.
- A 1/2” conduit is useful or breaking loose stuck-on material.

2. MARK TUBING LOOPS ON PANELS

- Follow the Tubing Layout plan set and mark the tubing paths on your panels with a permanent marker.
- Clearly mark turns, bury points, custom routes, and manifold locations.
- Mark locations of all plumbing waste lines.
- Mark each loop to avoid any future confusion.

3. RETURN LINES TO MANIFOLDS

To return the PEX tubing back to the manifolds, there are a few different options which will work.

- **Method 1**
  Use the existing channels in the panels to return the tubing to the manifold.

- **Method 2**
  Create custom routes in the panel and return the tubing back to the manifold.

- **Method 3**
  Create a bury point and feed the tubing back to the manifold by going through the subfloor. (see example to right).

- **Method 4**
  Use the “panel cut back” to create a tubing channel above the subfloor/slab for the tubing to return to the manifold. Fill with Portland Cement to create a level surface. (see example to right).

To create a bury point, use a 3/4" drill bit and create a 3/4" x 1 1/2" hole. This will help prevent the tubing from kinking.

Visit warmboard.com/videos for further instruction and information.
4. CREATE CUSTOM ROUTE
- Follow the instructions outlined on page 11

5. INSTALL TUBING
- Installing tubing at temperatures below 50°F is not advised as the tubing becomes more rigid and difficult to bend
- ONLY use tubing from our “Approved Tubing List” (page 5)
- Use a 16oz. rubber mallet to secure the tubing in the channel (be sure the tubing sits level and flush with the top of the panel)
- DO NOT use silicone/adhesive in the channels
- Tape the ends of the tubing to prevent debris from clogging the lines
- A tubing uncoiler is an excellent investment and recommended for large jobs
- Use nail plates to secure tubing as needed and remove before finish floors are installed

The tubing must be level and flush with the surface of Warmboard.

6. INSTALL MANIFOLD
- Follow all installation details and specifications documented by the manufacturer. Manifolds are usually placed in closets or between interior wall stud bays with an access door
- Clearly mark all supply and return loops, documenting rooms and zones on manifolds to avoid future confusion
- Pressure test all loops to the mechanical code requirement of 100 PSI for 15 minutes. Note: 5-10% of the air will settle and cause the PSI to drop
- After the 15 minutes, lower the air pressure to 60 PSI and maintain during the construction process. Note: 5-10% of the air will settle and cause the PSI to drop

7. TUBING REPAIR
If tubing damage does occur it is an easy fix. Every tubing manufacturer makes repair couplers to repair a punctured section of tubing. Simply pop out the tube, cut out the damaged area and insert a coupling. Because the couplings are larger in diameter than the PEX tube, the installer will have to chisel the groove slightly to accommodate the coupler. Average time to fix a punctured tube is typically 30 minutes.

Consider using Ram Board or equivalent to help protect tubing in high traffic areas.

Hardwood Flooring Overview

The application of solid hardwood floors over a radiant heated floor is approved by many hardwood manufacturers and trade organizations. Warmboard panels installed with hardwood floors is a proven successful technology.

There are many misconceptions about hardwood flooring and radiant floor heating, much of which comes from the wood flooring industry itself. But here are some facts:

- All wood products, from flooring to guitars, naturally expand and contract with changes in moisture levels. This occurs regardless if the heat is coming from the floor, a forced air system or the sun
- The minor movement in wood floors has been taking place for hundreds of years, but the movements are small, and most homeowners never notice
- The only effect radiant floor heating has on wood flooring is to lower its moisture content. This minor change is not visible
- If wood flooring with a low moisture content (6-9%) is installed over Warmboard, there will be no gapping or cupping of the floor
- If wood flooring is installed with a high moisture content (over 9%), gapping or cupping may occur. For this reason, it is essential to acclimate the wood properly prior to installation

**SOLID WOOD RECOMMENDATIONS**

Use a wood species that is dimensionally stable. There are three types of cuts from the tree: Quarter sawn, Rift sawn and Plain sawn. Quarter sawn and Rift sawn is a better choice and will be more dimensionally stable over the Warmboard.

Anything wider than 3 3/4” is referred to as “plank flooring”. Anything narrower than this is called “strip flooring”. In general, strip flooring is more dimensionally stable. However, plank flooring has been installed over Warmboard successfully in thousands of projects with widths above 18”.

We recommend 3/4” solid plank (rift or quarter sawn) flooring. If using other types of wood flooring, we still recommend the 3/4” thickness.
WOOD FLOOR ACCLIMATION

Before hardwood is on site, ensure the interior plastering is complete and dry, and that the radiant system has been operating for a couple weeks in order to reduce any excess moisture in the Warmboard panels. In some locales, you may need to operate the air conditioner simultaneously to control the indoor humidity. The hardwood should experience consistent, low humidity once on site.

Be aware of any moisture or humidity intrusion that may take place in the future, such as a crawl space beneath Warmboard which could be dry in the summer months and experience water intrusion in the winter months. This could cause large humidity swings and movement of the finished hardwood floor.

Once the interior space is properly conditioned, bring in the wood planks and sticker them – pulling the planks out of their boxes and setting them up so air can circulate around them (see photo).

Prior to flooring installation, the moisture content of Warmboard–R should be 12% or less. The moisture content of the finish hardwood should be within 4% of Warmboard–R, ideally between 6-9%, though this will vary by climate zone. Be sure to discuss this with your flooring installer.

It will be difficult to get a moisture reading from Warmboard due to its aluminum surface, so we recommend using a moisture meter with insulated contact pins and hammer probe. The Delmhorst J4 and J2000 models from delmhorst.com are good options, and can be upgraded with the necessary pins and hammer probe.

Keep the moisture level of the hardwood low before installation to ensure long term stability. Maintain an indoor ambient temperature between 60–80°F (15–26°C), and keep the humidity between 30–50%.

It is standard practice, and crucial, to acclimate wood flooring prior to installation. Acclimation time can vary by season, but 2 weeks is recommended.
3 INSTALLATION METHODS

- **Method 1**
  Nail hardwood directly

- **Method 2**
  Nail and glue hardwood directly

- **Method 3**
  Glue hardwood directly (no fasteners)

**APPROVED ADHESIVES**

- Bona R851, R859, R850T
- Bostik’s BEST, BST, ProCure, EFA+, Vapor-Lock, Ultra-Set SingleStep 2, GreenForce, Pro-MSP, HDAC, Climb
- Mapei Ultrabond Eco 975, 980
- Sikabond T-35 and T-55
- Stauf Adhesives PUM-950 Power Mastic
- Titebond 811, 821, 771
- Wakol MS 260, PU 225

Warranty letters from these companies are available upon request.

**METHOD 1 NAIL DIRECTLY**

Installing the hardwood perpendicular to the tubing pattern is the easiest method. It is important to see the tubing as the hardwood is nailed to avoid tubing damage. It is recommended to tongue nail at a 45 degree angle at 6” on centers and use 2” flooring nails.

Occasionally, plank flooring may need to run the same direction as the tubing, and nailing the plank could cause tubing damage. Should this occur, DO NOT nail – either glue with an approved adhesive or face nail the plank. While the planks can be successfully nailed down parallel to the tubing pattern, this method may require extra labor. Strategic planning with the layout can avoid face nailing and gluing in many locations.

When installing hardwood parallel to the tubing pattern, rip the first plank at an appropriate width to create a nailing pattern which will avoid the tubing at all T&G locations.
METHOD 2 NAIL AND GLUE DIRECTLY

Aside from the glue itself, you do not need to install additional material between the Warmboard panel and the hardwood.

Installing planks perpendicular to the tubing pattern is the easiest method. It is important to see the tubing as the planks are nailed to avoid tubing damage. It is recommended to tongue nail at a 45 degree angle at 6" on centers and use 2" flooring nails.

Occasionally, plank flooring may run the same direction as the tubing, and nailing the plank could cause tubing damage. Should this occur, DO NOT nail – the glue will successfully bond the plank to the Warmboard panel.

METHOD 3 GLUE DIRECTLY

Aside from the glue itself, you do not need to install additional material between the Warmboard panel and the hardwood.

Use the approved adhesives listed on pages 17 and 19.

OPERATING THE RADIANT SYSTEM

Circulate low water temperatures under the newly installed floor for the first few days. Then, gradually bring the water temperature up to the designed set point. For example, start with 90°F water and after a few days, bring it up to 100°F. Finalize the set point according to the needs of structure.

It is ideal for the heating system to be designed with the “Outdoor Reset” control strategy. This method sets up a heating curve that modifies the delivered water temperature based on the current heat loss of the structure. This is an excellent strategy for hardwood flooring.

Surface temperatures of the finish flooring should not exceed 85°F.
Installing Engineered, Laminate and Bamboo Flooring

4 INSTALLATION METHODS

- Method 1
  Floating Floor

- Method 2
  Nail planks directly

- Method 3
  Nail and glue planks directly

- Method 4
  Glue the planks directly (no fasteners)

- Titebond 811, 821, 771
- Wakol MS 260, PU 225

Warranty letters from these companies are available upon request.

METHOD 1 FLOATING FLOOR

This is a great option because the floorboards are locked together at the joints of each board and not nailed or adhered to the subfloor. This allows the whole floor to move as a single unit if a dimensional change within the floor takes place.

We highly recommend installing acoustic padding between the Warmboard and the planks. A good option is the “Roberts’ AirGuard Premium 3-in-1 Underlayment with Microban” which can be found at Home Depot.
METHOD 2 **NAIL DIRECTLY**

You do not need to install additional material between the Warmboard panel and the hardwood.

Installing the planks perpendicular to the tubing pattern is the easiest method. It is important to see the tubing as the planks are nailed to avoid tubing damage. It is recommended to tongue nail at a 45 degree angle at 6" on centers and use 2" flooring nails.

Occasionally, plank flooring may need to run the same direction as the tubing, and nailing the plank could cause tubing damage. Should this occur, **DO NOT** nail – either glue with an approved adhesive or face nail the plank. While the planks can be successfully nailed down parallel to the tubing pattern, this method may require extra labor. Strategic planning with the layout can avoid face nailing and gluing in many locations.

METHOD 3 **NAIL AND GLUE DIRECTLY**

Aside from the glue itself, you do not need to install additional material between the Warmboard panel and the hardwood.

Installing planks perpendicular to the tubing pattern is the easiest method. It is important to see the tubing as the planks are nailed to avoid tubing damage. It is recommended to tongue nail at a 45 degree angle at 6" on centers and use 2" flooring nails. Occasionally, plank flooring may run the same direction as the tubing, and nailing the plank could cause tubing damage. Should this occur, **DO NOT** nail – the glue will successfully bond the plank to the Warmboard panel.

METHOD 4 **GLUE DIRECTLY**

Aside from the glue itself, you do not need any additional material between the Warmboard panel and the hardwood.

Use the approved adhesives listed on pages 17 and 19.

---

When installing hardwood parallel to the tubing pattern, rip the first plank at an appropriate width to create a nailing pattern which will avoid the tubing at all T&G locations.

---

Surface temperatures of the finish flooring should not exceed 85°F.
Installing Tile

Tile or stone set to Warmboard–R is subject to all of the tile setting requirements of any ordinary unheated wooden subfloor.

**TCNA TESTING**

The TCNA (Tile Council of America) has successfully tested six different tile methods over the Warmboard–S panel. The purpose of this testing was for an expert third party to endorse best practices for installing tile and stone over Warmboard. The testing method used was ASTM C627 (The results of the Robinson Floor Test can be made available upon request).

Note, that while we have tested Warmboard–S, we have not tested Warmboard–R. Due to the near identical properties of both of these products, we are convinced that both will perform equally under established test conditions. Over the years, we have not experienced anything in the field to contradict this.

**TCNA RATINGS AND DESCRIPTION**

- **Residential Rating**
  Suitable for homes (tile survived 3 cycles of testing with no evidence of damage)

- **Light Commercial Rating**
  Suitable for office spaces, etc. (tile survived 6 cycles of testing with no evidence of damage)

- **Moderate Rating**
  Suitable for hospitals, etc. (tile survived 10 cycles of testing with no evidence of damage)

- **Heavy Rating**
  Suitable for shopping malls, etc. (tile survived 12 cycles of testing with no evidence of damage)

- **Extra Heavy Rating**
  Suitable for airports, etc. (tile survived 14 cycles of testing with no evidence of damage)

**RECOMMENDED ASSEMBLIES**

- **Method 6**
  Uncoupling Membrane, Mapei
  Mapei Approved: Light Commercial

- **Method 7**
  Uncoupling Membrane, Schluter
  TCNA Rating: Light Commercial

Warmboard Inc. is not an agent for the manufacturers listed herein, and gives no implied warranty for any of these products or manufacturers on these assemblies.

Make sure any products and methods chosen meet the standards established by the TCNA, ANSI and ICC. Follow the manufacturer’s specific recommendations when using these products.

Surface temperatures of the finish flooring should not exceed 85°F.
Always take care to avoid tubing damage.
Method 1  **Backer Board**

There are a variety of Cementitious Backer Units (CBUs) available. Backer boards have low mass and are relatively inexpensive to install. They are available in thicknesses of 1/4" and 1/2" and provide a base for tiled areas which will match up well with adjacent finish flooring.

Apply Thin-Set to the surface of Warmboard using a square-notched trowel – this layer will function as a butter coating. Immediately fasten the Backer board using “Backer board screws” before the Thin-Set dries (see page 23 for avoiding tubing damage). Use Backer board tape on all seams then apply Thin-Set. Finish with tile or stone.

Backer board must run perpendicular to the Warmboard panels. Be sure to stagger the seams and take special care when fastening to avoid tubing damage.

This specific assembly was TCNA tested. Substituting with other comparable brands that meet ANSI standards is acceptable.

A warranty letter from Custom Building Products for the use of WonderBoard® over Warmboard-R is available upon request.

Surface temperatures of the finish flooring should not exceed 85°F.
Use a clear polyethylene plastic sheet (3 or 4-mil) and a permanent marker to quickly create a stencil of the tubing pattern. Place this stencil over the Backer board to safely install fasteners and avoid tubing damage.

1 Cut the polyethylene to the size of Backer board. Save time by cutting all of your full size 3' x 5' plastic stencils at once. **DO NOT** cut directly over the Warmboard or the tubing.

2 Place the cut sheets over the Warmboard panel and tape down the corners. With a permanent marker, trace the tubing pattern, and clearly mark the top and bottom on the stencil. Remove plastic and lay flat next to work area.

3 Trowel a coat of Thin-Set over the Warmboard panel and place the Backer board over to the appropriate location.

4 Align and tape the stencil down over the Backer board. Pre-drill all safe fastening locations, then remove stencil and fasten as normal.

Take care to avoid tubing damage.
Method 2 3/4" Mud Bed

Mortar beds have been the traditional method of addressing the expansion, contraction and deflection properties of wooden subfloors while providing a thick, continuous and stable surface to which tile readily adheres. The disadvantage is that they tend to be expensive, add significant mass to a system, and due to their thickness, often cause the elevation of tile areas to not align well with adjacent carpeted or hardwood areas.

When applying the mortar, install a layer of 4- or 6-mil polyethylene to serve as a cleavage membrane. Fasten down a diamond wire mesh lath over the membrane using crown staples and finish with a minimum 3/4" mortar bed (Mapei® 4-to-1 Mud Bed Mix or equal). After the mortar bed has cured, Thin-Set. Tile or stone may then be applied.

This specific assembly was TCNA tested. Substituting with other comparable brands that meet ANSI standards is acceptable.

Surface temperatures of the finish flooring should not exceed 85°F.
Method 3 3/8" Self-Leveling Underlayment

The main advantage of this product is the thin profile with the great strength of a mortar bed.

To proceed, clean the panels and apply “Mapei Primer T” (per Mapei instructions). Follow with the diamond wire mesh lath and attach with crown staples. Mix and apply “Ultraplan® Easy” at a thickness of 3/8” or more. Finish with Thin-Set, the tile or stone can be applied.

This specific assembly was TCNA tested. Substituting with other comparable brands NOT recommended.

Surface temperatures of the finish flooring should not exceed 85°F.
Method 4 Uncoupling Mat, RedGard

The RedGard® Uncoupling Mat is a water and vapor-proof uncoupling membrane that can be used for crack-isolation in most tile, porcelain or natural stone installations. This product absorbs stress and preserves the surface and integrity of the tile. RedGard Uncoupling Mat’s bonding layers have reinforced fleece which locks mortar into the mat, ensuring strong, reliable installations.

To install, clean the panels and apply the “Mapei Granirapid® Thin-Set Mortar” using a v-notched trowel. Immediately install the RedGard Uncoupling Mat. The next day, follow with Thin-Set using a Square-notched trowel. Finish with tile or stone.

Summary of the TCNA “Bond Strength Test” performed with Warmboard and Mapei Granirapid:

- Warmboard–S with Granirapid averaged 217 PSI
- Plywood with Granirapid averaged 240 PSI
- Minimum requirement is 50 PSI

Test results are available upon request.

This specific assembly was TCNA tested. Substituting with other comparable brands NOT recommended.
For stone and tile installations, Blanke • PERMAT offers amazing crack isolation protection and superior compression and tensile strength. The Blanke • PERMAT reinforced mesh panel adds major support to wood subfloors, greatly reducing vertical subfloor movement (deflection).

To proceed with this installation, clean panels, trowel on the Mapei “Granirapid Thin-Set Mortar” using a V-notched trowel. Immediately install the Permat. The next day, follow with Thin-Set using a Square-notched trowel. Finish with tile or stone.

Summary of the TCNA “Bond Strength Test” performed with Warmboard and Mapei Granirapid:

- Warmboard–S with Granirapid averaged 217 PSI
- Plywood with Granirapid averaged 240 PSI
- Minimum requirement is 50 PSI

Assembly test results and/or warranty letter from Blanke, Inc. for the use of PERMAT over Warmboard–R are available upon request.

This specific assembly was TCNA tested. Substituting with other comparable brands NOT recommended.

Surface temperatures of the finish flooring should not exceed 85°F.
Method 6 Uncoupling Membrane, Mapei

Mapeguard UM is a premium-performance, lightweight, waterproofing and vapor-pressure equalizing underlayment membrane that provides crack suppression for use under ceramic tile and stone installations. Apply a layer of Mapei’s “Granirapid Thin-Set Mortar” (a premium rapid-setting and flexible polymer-modified mortar) directly to the Warmboard, using a V-notched trowel, and then install the Mapeguard UM. Wait until the mortar is completely dry below the Mapeguard UM, then trowel on an unmodified thin set mortar that meets or exceeds ANSI A118.1 on the topside of the Mapeguard UM, and immediately install tile or stone.

Summary of the TCNA “Bond Strength Test” performed with Warmboard and Mapei Granirapid:

- Warmboard–S with Granirapid averaged 217 PSI
- Plywood with Granirapid averaged 240 PSI
- Minimum requirement is 50 PSI

Assembly test results are available upon request.

This specific assembly was TCNA tested. Substituting with other comparable brands NOT recommended.

Surface temperatures of the finish flooring should not exceed 85°F.
DITRA is a polyethylene membrane with a grid structure of square cut cavities and an anchoring fleece laminated to its underside. Apply a layer of Mapei’s “Granirapid Thin-Set Mortar” (a premium rapid-setting and flexible polymer-modified mortar) directly to the Warmboard, using a V-notched trowel, and then install the DITRA grid. Wait until the mortar is completely dry below the DITRA, then trowel on an unmodified thin set mortar that meets or exceeds ANSI A118.1 on the topside of the DITRA, and immediately install tile or stone. There have been hundreds of successful tile installations installed by this method with no reports of problems or failure.

Summary of the TCNA “Bond Strength Test” performed with Warmboard and Mapei Granirapid:

- Warmboard–S with Granirapid averaged 217 PSI
- Plywood with Granirapid averaged 240 PSI
- Minimum requirement is 50 PSI

Assembly test results are available upon request.

Schluter does not warranty any interface with Warmboard.

This specific assembly was TCNA tested. Substituting with other comparable brands NOT recommended.
Padding and carpet is a very common finish floor to use over Warmboard. The carpet cushion (padding) can be installed directly over Warmboard. Before installing the carpet cushion it is necessary to fill all of the empty grooves to provide an even surface for installation (scrap PEX tubing is a good option). Another option is to use a floor leveling compound or Portland cement to fill the empty grooves making them flush and level with the panel surface. Do not install padding and carpet until all the loops have been properly pressure tested.

When choosing a carpet cushion/carpet assembly we recommend a product that has a low R-value rating. By keeping this R-value low, the system can use the same water temperatures beneath all finish flooring types. To achieve this one temperature system, it is best to purchase a carpet and carpet cushion assembly that does not exceed an R-value of 2.0–2.5. Higher values may require creating a two temperature system.

</table>

While many brands of carpet padding are available in the marketplace, we DO NOT recommend Prime Urethane, Bonded Urethane or Sunburst products due to their high R-values.

### Carpet Thickness Approximate R-value

<table>
<thead>
<tr>
<th>Thickness</th>
<th>R-value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/8&quot;</td>
<td>+/- 0.6</td>
</tr>
<tr>
<td>1/4&quot;</td>
<td>+/- 1.0</td>
</tr>
<tr>
<td>1/2&quot;</td>
<td>+/- 1.4</td>
</tr>
<tr>
<td>3/4&quot;</td>
<td>+/- 1.8</td>
</tr>
<tr>
<td>1&quot;</td>
<td>+/- 2.2</td>
</tr>
</tbody>
</table>

The R-values listed above are approximate based on carpet thickness. Check with the manufacturer to obtain accurate values.

Surface temperatures of the finish flooring should not exceed 85°F.
Cork flooring has a naturally high insulation value so it is important to choose one that is 3/8” to 1/2” in thickness when working with radiant heat. This will keep the R-value to 1.5 or less giving better heating and response times, while simplifying the mechanical design at the same time. A more simple mechanical design means your cork floor will operate in the same water temperature range as tile, hardwood or carpet.

Established brands include Expanko Cork (expanko.com), American Cork (amcork.com), and Natural Cork (naturalcork.com).

**STANDARD CORK FLOORING**

The installation of an underlayment is required over the Warmboard surface before standard cork flooring is installed. Care should be taken when fastening the underlayment to Warmboard because the tubing is obscured during this step. We recommend installing a 1/4” APA listed plywood underlayment with a sanded face. For complete installation details, refer to the “Engineered Wood Construction Guide” at apawood.org. Complete the installation of the cork by following all the manufacturer guidelines and specifications.

Once the underlayment is installed, the cork is adhered using a urethane adhesive made for cork applications. A good product to use is “Dri Tac 7500” (dritac.com, 1.800.726.7845).

**CORK LAMINATE PRODUCTS**

Cork laminate products work well with Warmboard. These products contain an MDF layer sandwiched between two layers of cork. It is not necessary to put any barrier between the cork flooring and the Warmboard prior to installation. This type of cork floor installs as a floating floor and requires no adhesive or nailing for proper installation, allowing the homeowner more flexibility if they ever decide to change the floor covering.

Follow all installation instructions provided by your finish flooring manufacturer.
Installing Vinyl

There are several different types of vinyl flooring, and all can be used with Warmboard.

Increasing in popularity is the use of Luxury Vinyl Flooring (LVF) over Warmboard. This product emulates the look of natural materials like wood or stone. LVF is a very durable material and could be a great option for areas of the home expecting a lot of wear and tear.

For all vinyl installations, we recommend installing a substrate underlayment between the Warmboard and the vinyl finish floor.

**SUGGESTED UNDERLAYMENTS**

- 1/4" or 1/2" interior plywood or OSB
- 1/4" or 1/2" tile backerboard (bathrooms, kitchens)

If the vinyl is being used in conjunction with other types of flooring, consider the underlayment which will help keep floor heights consistent between flooring types.

We recommend using the “stencil method” on page 23 to avoid tubing damage. For tile Backer board installation, see page 22.

When using a plywood or OSB (or equivalent) underlayment, you must fully acclimate the panels before installation. If the underlayment is too high in moisture, they will shrink from the floor heating and create an installation failure.

DO NOT use adhesive with your plywood or OSB panel, just staples or screws.

Follow all installation instructions provided by your finish flooring manufacturer

Surface temperatures of the finish flooring should not exceed 85°F.
Installing Linoleum

For all linoleum installations, we recommend installing a substrate underlayment between the Warmboard and the vinyl finish floor.

**SUGGESTED UNDERLAYMENTS**

- 1/4" or 1/2" interior plywood or OSB
- 1/4" or 1/2" tile backerboard (bathrooms, kitchens)

If the linoleum is being used in conjunction with other types of flooring, consider the underlayment which will help keep floor heights consistent between flooring types.

We recommend using the “stencil method” on page 23 to avoid tubing damage. For tile Backer board installation, see page 22.

When using a plywood or OSB (or equivalent) underlayment, you must fully acclimate the panels before installation. If the underlayment is too high in moisture, they will shrink from the floor heating and create an installation failure.

DO NOT use adhesive with your plywood or OSB panel, just staples or screws.

Follow all installation instructions provided by your finish flooring manufacturer

Surface temperatures of the finish flooring should not exceed 85°F.
